

StreamManager 6.0b1 Read Me

StreamManager System Component

Digidesign StreamManager is required for use with HTDM plug-ins on HTDM-compatible Pro Tools TDM systems (such as Pro Tools|24 MIX and Pro Tools|HD).

Buffer Size

The StreamManager component currently supports a buffer size of 512 samples only. Future versions will support smaller buffers to allow lower latency when using HTDM plug-ins.

StreamManager Beta Version

Due to late-breaking technical challenges in the Pro Tools 6.0 development cycle, we were unable to fully qualify StreamManager and therefore cannot guarantee flawless performance. Rather than exclude StreamManager from the release entirely, we have included it as a “beta” component. Please note that even though StreamManager is delivered as a “beta” version only, we do not know of outstanding issues at the time of this writing. When it is ready, Digidesign will add a fully-qualified version of StreamManager to a later Pro Tools release and to our Web site (www.digidesign.com).

Installation

To install StreamManager 6.0b1:

- 1 Quit Pro Tools and all other applications.
- 2 Copy the file “StreamManager” into the Library/Application Support/Digidesign folder.
- 3 Relaunch Pro Tools. Rebooting your CPU is not necessary.

We hope you will have great success using Digidesign StreamManager.
